

**Q1 . A farmer wants a program to perform basic calculations related to farming.
The program should:**

- Display the farmer's profile.
- Add the weights of two harvested crops.
- Find the square root of the total harvested area.
- Calculate the area of a triangular field.
- Swap the quantities of two fertilizer bags if entered in the wrong order.

CODE :

```
import math

# Farmer Profile
name = input("Farmer Name: ")
crop = input("Crop: ")
print("\nProfile:", name, "-", crop)

# Add crop weights
w1 = float(input("Weight 1: "))
w2 = float(input("Weight 2: "))
print("\nTotal Weight =", w1 + w2)

# Square root of harvested area
area = float(input("Harvested Area: "))
print("\nSquare Root =", math.sqrt(area))

# Area of triangular field
b = float(input("Base: "))
h = float(input("Height: "))
print("\nTriangle Area =", 0.5 * b * h)

# Swap fertilizer bag quantities
a = int(input("Bag 1 Quantity: "))
c = int(input("Bag 2 Quantity: "))
a, c = c, a
print("\nAfter Swapping:", a, c)
print("KOMAL S049")
```

Farmer Name: AYUSH

Crop: 2

Profile: AYUSH - 2

Weight 1: 10

Weight 2: 15

Total Weight = 25.0

Harvested Area: 15

Square Root = 3.872983346207417

Base: 20

Height: 15

Triangle Area = 150.0

Bag 1 Quantity: 25

Bag 2 Quantity: 30

After Swapping: 30 25

KOMAL S049
